ABSTRACT

This report presents selected findings from the "Consolidated" survey of the Integrated Postsecondary Education Data System program of the National Center for Education Statistics (NCES). Data are presented on enrollment and completions in non-collegiate postsecondary institutions in the United States and its outlying areas. The NCES surveyed a sample of 2,998 of the 6,509 non-collegiate postsecondary schools in the fall of 1990. Nearly 1 million students were enrolled in such institutions in the fall of 1990. Of the total enrollment, over 50 percent were women, and approximately 66 percent attended school full time. For-profit institutions made up 53 percent of the total. Approximately 64 percent of the students were enrolled in less-than-two-year institutions. Approximately 710,000 students completed programs in these institutions between July 1, 1989 and June 30, 1990. The survey methodology is described, and the summary statistics are presented in seven tables. (SLD)

Introduction

This report presents selected findings from the "Consolidated" survey, which is part of the Integrated Postsecondary Education Data System (IPEDS) program conducted by the U.S. Department of Education's National Center for Education Statistics (NCES). IPEDS provides comprehensive data on the nation's postsecondary education enterprise; however, this report will be limited to a subset of the IPEDS universe--the noncollegiate sector.

This publication contains data on enrollment and completions in noncollegiate postsecondary institutions in the United States and its outlying areas. NCES surveyed a sample of 2,998 of the 6,509 noncollegiate postsecondary schools in the fall of 1990. For purposes of this report, the noncollegiate schools are defined as those institutions on the IPEDS file that (1) are not accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education; and (2) do not grant a bachelor's, master's, doctor's, or first-professional degree.

The tables included in this report present national estimates for enrollment and completions based on sample data. The survey methodology section contains an explanation of the sampling techniques and the weighting procedures.

Fall enrollment data reflect student counts as of the institution's official fall reporting date or October 15, 1990. More than half of the institutions in the noncollegiate universe are less-than-2-year institutions, whose programs are often of short duration, and students may enroll in them at any point during the fall term. Thus, enrollment over the entire fall term at the less-than-2-year institutions will be somewhat higher than what is reported here, which is as of a single point in time (October 15). Completions data are for the entire 12-month period from July 1, 1989 through June 30, 1990, and data are therefore comparable for institutions with programs of varying length.

Highlights

- Nearly 1 million students were enrolled in noncollegiate postsecondary institutions in the fall of 1990. Over one-half were women and about two-thirds attended full time.
- For-profit institutions accounted for 53 percent of the total enrollment, while public institutions attracted a 33 percent share.
- The largest number of students, 616,000 or 64 percent, were enrolled in less-than-2-year institutions.
- About 710,000 students completed programs in these institutions between July 1, 1989 and June 30, 1990.
- About 63 percent of the awards were in programs of under 1 year, while a substantial number of awards (nearly 202,000 or 28 percent) were in programs of at least 1 but less than 2 years in length.

Survey Methodology

Overview

The Consolidated (CN) survey form was used for the first time in 1990-91 to collect information from the noncollegiate schools, a subset of the 10,500 postsecondary institutions in the Integrated Postsecondary Education Data System (IPEDS) universe. IPEDS collects information on such topics as institutional characteristics, enrollment, completions, finance, staff, and libraries. All schools in the IPEDS universe are asked to complete an institutional characteristics form; however, data on the other topics are collected from a sample of institutions. Approximately 3,600 accredited institutions of higher education (i.e., those that are accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education) plus another 400 "non-accredited" schools that grant a bachelor's, master's, doctor's, or first-professional degree were asked to complete the full complement of IPEDS surveys. The remaining 6,500 noncollegiate postsecondary schools were eligible to receive the CN survey form.

The CN form was sent to all non-accredited schools that grant certificates beyond the bachelor's level, all non-accredited 2-but-less-than-4-year institutions, all non-accredited public less-than-2-year schools, and a sample of 1,200 non-accredited private less-than-2-year-schools. In all, 2,998 noncollegiate institutions received the CN form in 1990.

The following data were requested from the noncollegiate schools using the CN survey form: (a) fall enrollment for 1990, by racial/ethnic category and sex of student; (b) completions for the 1989-90 academic year, by field of study and award level and by racial/ethnic category and sex of recipient; (c) financial statistics for fiscal year 1990; and (d) selected data on libraries. The single CN form substituted for the four detailed IPEDS surveys that were sent to the institutions of higher education, as defined above. The CN form is an abbreviated survey form especially designed for the smaller non-accredited institutions, thus the data items are not normally as detailed as those on the individual IPEDS survey forms.

Institutions that received the CN form were not accredited at the college level at the time the forms were mailed; however, during the processing cycle, 31 institutions changed status and became institutions of higher education. Data from these institutions have been removed from the tables.

Coverage

The Consolidated (CN) survey forms for 1990 were mailed to 2,998 noncollegiate postsecondary institutions in July 1990, including 91 4-year and above institutions that granted *only* graduate-level certificates; all 1,411 "non-accredited" 2-year institutions, and a sample of 1,496 less-than-2-year institutions.

During the data collection period, 393 institutions were deleted from the CN survey universe. The deletions resulted from formal notification by IPEDS state coordinators, the Department of Education eligibility notices, and from followup telephone calls. Included in

¹ "Non-accredited" schools are those that are not accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education.

the deletions were schools that had closed, those that no longer offered postsecondary education, and duplicates on the file. This E.D. TABS also excludes data from the 31 schools now considered institutions of higher education that completed CN surveys.

Followup

Extensive followup activities began in January 1991, and were conducted by telephone. The Computer-Assisted Telephone Interview (CATI) system was used to solicit selected key data from institutions that did not file a CN survey. Institutions were requested to supply information on fall enrollment, completions in the three largest programs, and finance and library data. Partial respondents (those that completed selected parts of the survey form) were not contacted during followup.

The overall institutional response rate was calculated as the ratio of the number of responses divided by the number of schools eligible for the survey (i.e., the number of forms mailed minus the number determined to be out-of-scope). Two schools were added to the CN file after mailout. These schools were mailed IPEDS forms, but lost their accreditation during the processing cycle, and thus were no longer considered institutions of higher education. A summary of the institutional response is provided in Table 3. More detailed information on institutional response can be found in Table 4. Note that counts included in this table are based on the final determination of institutional sector; they do not reflect sector at time of mailout. For instance, if a school was in sector 7 (public, less-than-2-year) at mailout, but changed to sector 4 (public, 2-year), it is considered a sector 4 school in all columns of this table.

Because response rates varied widely by Part (i.e., Part A - Enrollment, Part B - Completions)--Table 5 is provided to display response rates by Part.

Edit and Error Resolution

During editing, all forms were checked for CIP code validity and addition errors. For fall enrollment, row totals were generated and compared to reported totals. For completions, row totals were generated and compared to the reported totals for each award level and CIP program category. If the reported totals were within pre-established tolerance levels, the difference between the reported total and the generated total was placed into a "balance" column; otherwise, institutions were contacted to resolve the discrepancies.

Totals were generated for each racial/ethnic category and the grand total columns for men and women were compared with the reported totals. When detail data in each column did not add to the totals reported, those within tolerance were corrected. Institutions were contacted to resolve all other discrepancies.

The data for each institution were also compared to the prior year's reported data to ensure consistency in reporting. If the difference between the earlier response and the 1990 response was out of range, the institution was called for verification.

Imputation Procedures

After the editing of the CN form was complete, the file was split into four separate files: enrollment, completions, finance, and libraries. Data were combined with the information collected from the institutions of higher education before assessing the file to determine where imputations were needed. NCES imputed data for nonsampled nonrespondents to Part A (fall enrollment) and Part B (completions) only. Imputations for parts A and B were performed as part of the imputation process for the Fall Enrollment (EF) survey and the Completions (C) survey. These imputations were primarily based on the prior year's response for institutions that filed IPEDS surveys in 1989. Otherwise, donors were selected for nonrespondent institutions using a hot deck methodology. Sampled schools were not imputed if they did not respond. Instead, weights were adjusted for those sampled schools that did respond. Once imputations were complete and the sample weights were adjusted for nonresponse, the CN portions of each file were copied back into the CN database.

There were no imputations performed on Parts C (finance) and D (libraries), because of the unique characteristics of many of these schools. For this reason, there has been no attempt to estimate national totals in these two areas for the noncollegiate postsecondary schools.

1990 Sample of Private Less-Than-2-Year Institutions

A nationally representative sample of institutions in the private nonprofit and private for-profit less-than-2-year sectors was drawn with probability of selection proportionate to the square root of enrollment. Interval sampling was used, sorting the sampling frame by stratum (see section on stratification), sector, and zip code.

Sampling Frame

The sampling frame used for this sample was the best available as of June 1990, and contained 5,054 private nonprofit and private for-profit less-than-2-year institutions. Of the schools in these two sectors, 1,200 were selected.

Stratification

The sampling frame was divided into two strata: (1) institutions that had previously been sampled through the IPEDS survey system; and (2) new institutions in the 1990-91 IPEDS universe that had responded to the previous year's Institutional Characteristics (IC) survey and were determined to be in the private less-than-2-year category. Since enrollment data were collected on the IC survey, the two strata were sampled with probability proportionate to the square root of enrollment after adjustments were made for expected response rates.

²Hot decking involves inserting individual values drawn from similar responding units. Imputations for schools with no prior response were based on hot deck selection of similar institutions that provided valid reports. A donor school was randomly selected from the same stratum as the nonresponding institution, where strata were defined by size (number of students enrolled) and sector. Sector is determined by institutional control and highest level of offering.

Derivation of Weights

The base weights are the inverse of the sampling probabilities. The final sample weights were produced by adjusting the base weights to account for nonresponse by other institutions in the sector and stratum. Note that weights were adjusted on the separate files (EF and C) before reassembling the CN file.

National Estimates

National estimates were produced by taking the value for each institution and multiplying it by the institution's sample weight to get a weighted value. The weighted values were then summed over all institutions in the sectors of interest. The sample weights reflect the fact that each sampled institution represents not only itself but also other (nonsurveyed) institutions in the same stratum.

Size Measure

The sample was drawn proportionate to size, with size defined as the square root of total enrollment. The square root was used to provide a good compromise between a sample optimized for student counts and a sample optimized for school counts. Using a size measure of 1 for each school would provide an exact match of school counts by stratum. Using a size measure of total enrollment would provide an exact match of student counts per stratum, but a relatively poor match of school counts. This is because of the large variation in total enrollment per institution. Total enrollment as a size measure would also provide an exceptionally poor sample of small schools.

Sampling and Nonsampling Error

There are two kinds of errors which affect the accuracy of an estimate based on a sample survey: sampling and nonsampling. Sampling error is the error in an estimate which occurs because the estimates are based on a probability sample of institutions, rather than on all institutions. Nonsampling errors are those errors which would remain even if a complete census of the institutions were attempted, including errors due to nonresponse, reporting errors, and others discussed below under the heading "Nonsampling Error."

Item Nonresponse

Data collected through the Computer-Assisted Telephone Interview (CATI) system may not be as complete as data supplied by institutions that responded in writing. For example, data collected by CATI on completions by CIP code and level were requested for the three programs with the largest enrollment only and were limited to total men and total women (no racial/ethnic breaks were requested). Thus, the numbers in the tables may underestimate the total number of degrees awarded. All completers in these institutions are shown as race unknown in the tables.

Sampling Errors

The sampling standard errors for the major program enrollment statistics in this survey were estimated using a balanced repeated replication methodology. These standard errors enable one to construct confidence intervals. For example, if all possible samples were selected, each of these being chosen under the same conditions as the current sample,

4

then 95 percent of the intervals from 1.96 standard errors less than the estimate to 1.96 standard errors more than the estimate would include the average result of all possible samples. The sampling standard errors have been estimated by a procedure called balanced repeated replication. This procedure takes into account the complexities of the sample design and the weighting of institutions.

Nonsampling Error

The percentages of institutions responding to the survey by sector and stratum vary by Part. Weighting adjustment, described previously, partially corrects for any bias on the sample responses due to nonresponse error. ("Bias" is the difference, averaged over all possible samples, between the estimated and true value of a quantity.) However, biases will persist to the degree that the responding institutions in a sector and stratum are not representative of the nonresponding institutions. For example, it may be that larger institutions are more likely to respond than the smaller size ones.

In addition to nonresponse, there are many other potential sources of nonsampling error. These include definitional difficulties, differences in the interpretation of questions, errors by the institutions providing the data, and errors made in recording the data. No measure of the nonsampling error from such sources is currently available.

Acknowledgments

The author wishes to thank the many institutional respondents who invested their time and effort to report accurate data; the reviewers for their helpful comments; and the editorial staff for their technical expertise.
